# Technology

Malak Amin Adel Abo Zein

Technology is the most important thing now.

There are different benefits of technology; they depend on how we use it. Do you think about how the world looked before and after technology?

Technology has changed our world entirely.

Before technology, people found it difficult to communicate with each other because there was no internet or smartphones.

Sir Tim Berners-Lee is the inventor of the internet.

The internet has made the world a small village, and it has made life easier. You do not need to meet someone in person, but you can use your smartphone camera for online meetings using applications such as WhatsApp and Zoom.

Technology helps us reduce the pollution ratio in the world by reducing the use of fossil fuels like gasoline. Gasoline is dangerous for the environment because people cannot use cars without it, but now we use electric cars to reduce the ratio of pollution, and the electric car is more efficient and cheaper than using petrol.

Some people prefer to do real shopping, and others prefer to do online shopping. Do you think this is the best type of shopping? In my opinion, online shopping is more useful because it has many benefits, like reducing air pollution. After all, when you want to go shopping, you go by car or taxi, and the streets become more crowded and the air pollution increases, which saves you time and effort. All of these things are the benefits of technology. Technology has helped me to develop my studies. Before I started to study using a laptop, I used and carried a lot of books. However, the laptop has helped me to study more easily and find information easily by using different search engines and resources. I sometimes use artificial intelligence like ChatGPT and Chat Gemini. We use technology to develop inventions like robots, devices, machines, and smartphones. The most important thing technology helps the world with is robots. Robots are the most intelligent machines because some countries use robots in many fields, like working in factories. Robots are faster and stronger machines that can achieve many things in a short time.

Some people use them in hospitals because robots are famous for their accurate work. I heard about robots doing operations that doctors cannot do. Some robots are used to drive cars because they are less likely to cause accidents and follow traffic rules. Some robots are used in driverless cars. In my opinion, driverless are important because they help elderly and disabled people who cannot drive cars. Women use robots in houses for cleaning, washing dishes, and doing many other jobs. Businessmen use robots to work in companies, do interviews for people, and do calculations and engineering jobs. Robots might make fewer mistakes than people. So, robots are very important. We can use technology in the biological field to make devices in hospitals. Without these devices, the ratio of deaths will increase in the world because there are many difficult operations people cannot do. We use technology in education because it makes it easier. Different schools and universities use more and more technology. Technology helps people because some people can work from home and earn a lot of money doing online jobs like marketing.

Marketing is the most famous job now because you can earn a lot of money while working from home. The most important invention on which all people depend is the internet. When you are a student, you will use technology to take online courses and attend online meetings with your teachers. You can use the technology to chat with friends and businessmen. You can use it to send emails and do online tasks. When you are an engineer, you can use it to create designs, plan projects, and do many other things.

To conclude, technology has been greatly developed, and it has developed the lives of people everywhere. People can use it for future developments as well.
